

# Paper Writing Service

Getting started on a school project is important to understand the differences between research activity and organization projects. The fundamental difference between research and design consists in solving problems. Project activities always focused on solving practical problems, obtaining a certain and predicted result whereas research activity relies on a wide range of knowledge that may not find practical application. Often, the researcher does not even know what result will come.

Through **research**, we identify what is already in the object or process, and designing, we will create something that is still not there. Project activities foster practical skills to create projects, implement them in a social environment, get the right information, collaborate with partners, lead other people, monitor situations, calculate risks, choose optimal tools for solving problems.

Research promotes self-help to gain knowledge, and is aimed at the formation of a research culture thinking based on the ability to: see contradictions and problems, hypothesize, establish, describe and explain facts, observe, conduct experiments.

Research process involves the use of methodological foundations of scientific activity, but at the same time it is still not scientific in the full sense of the word. Therefore more appropriate consider this activity as educational research, and those works what we included in our album are educational research projects.

An important process of activating the work of students in the learning process is the practice of organizing scientific groups of students, which include students of various courses. The objectives of such groups: ensuring mutual control of group members; fostering a sense of responsibility to their comrades for completing tasks; the acquisition of skills to manage the work of a team of senior students who can be appointed as leaders of scientific groups; ensuring continuity in scientific work; inculcation of scientific work skills in junior students not only by the head of work, but also by their senior comrades. A student working in a scientific group is forced, due to the specifics of student relations, to be constantly active, regardless of whether he wants it or not.
